

We've Got Your Back.

AR-75

Our troops need good reliable booster amplifiers in order to maintain critical communications links. Lives depend on it!

When clouded by the haze of marketing and advertising, booster amps might all look alike. Not true!

The truth is no other booster amplifiers are tougher, more dependable, more versatile and, most important, no booster amps are as easy to use as the Amps made by AR

AR booster amps ensure clean high performance signals. They deliver high peak AM signals with low distortion with only small input signals. They continue to provide full power despite high VSWR conditions - such as when on the ground or up against a building.

Their sophisticated DC power systems have full DC spike and surge protection. And DC regulation keeps RF output constant even when the input voltage drops down low.

AR Booster amps have been battle-tested with the U.S. Army, Navy, Marines, Coast Guard and FEMA with unparalleled success.

Our newest booster amplifiers – the AR-50 and AR-75 – are light years ahead of the competition. With features that really make a difference:

- Fast automatic switching through the 30 – 512 MHz range
- Compatible with all military communication protocols
- Separate antenna ports for line-of-sight and satellite communications
- Include LNAs, co-site filters and RF power level control

And, of course, all AR products are backed by the best warranty and support system in the industry. So don't let misinformation cause you to make a purchase decision that could put our troops in jeopardy.

For more information, call us at 425-485-9000 or visit us at ar-worldwide.com.
